Privately published under the auspices of the
EXECUTIVE COMMITTEE OF THE
FRIENDS OF THE ARMY MEDICAL LIBRARY
Washington, D. C.

LITERATURE COLLECTING

The collecting instinct is more or less highly developed in everyone. In the case of research workers it usually takes the form of collecting the literature pertaining to particular subdivisions of science. The text books used in student days often form the nucleus of a collection which is enlarged by more specialized treatises and reference books and later by the original papers of other research workers. These may be bulletins or individual reports of various kinds but for the most part consist of reprints of the articles published in scientific journals. The number of these which can be collected is very great, especially if one is aided by a capable secretary who writes for desired reprints and looks after their filing for future use. Most research workers, however, are not so fortunate as to have a secretary and the personal effort involved in collecting reprints may become a serious burden. Even at best only a small proportion of the current papers can be obtained as reprints and practically none of the older ones. Consequently, the system of gathering source material by the reprint method is not only exceedingly troublesome, but is quite inefficient. Furthermore, it usually happens that one collects many more reprints of papers on subjects with which he is not concerned than of those directly helpful. Due to this the decision in regard to keeping the miscellaneous ones or disposing of them in a befitting manner may become a source of embarrassment. In some institutions this problem is partially solved by having a free table on which may be deposited those reprints not wanted and from which one can select those he would like to add to his own collection.

As a substitute for the reprint method of collecting copies of scientific papers published in journals, microfilm copying services are being installed in many of the larger reference libraries. This method has the advantage of greater convenience and of supplying exactly what is wanted no matter when or where originally published. The microfilm copies so obtained may be filed in envelopes on which such identifying and other notes as desired may be written and occupy far less space than is required for full sized printed copies of the original papers. They may be conveniently read with the inexpensive (\$2.00) microfilm viewer, designed especially for the purpose, or in case large numbers are to be read there is now available a desk projector at \$32.00. It is apparent that microfilm copying is destined to play an increasingly important role in permitting those engaged in research to augment their collection of literature upon particular subjects.

CURRENT LIST OF MEDICAL LITERATURE is published weekly and lists of RECENT BOOK ACQUISITIONS are issued several times per year as supplements. The subscription price for both is \$5.00 per year in the United States and \$5.50 per year in other countries. The Recent Book Acquisitions may be obtained separately at \$1.00 per year.
